

Image Curation

The final image set, what was rejected and why, real vs. generated calls

What the content map needs

Need	Source	Why
Login screen	Real screenshot	Proves the isolation starts at session entry — own work
Chat view	Real screenshot	Shows the scoped session live — own work
Security Test tab (6/6)	Real screenshot	The actual proof — own work, most important image on the page
Favicon / site mark	Real asset (hand-coded SVG)	Needs exact hex + pixel control at tiny size — generation isn't precise enough here
Secondary icon / app-tile variant	AI-generated (kept)	Larger-format supplementary mark — precision matters less at this size
Hero image	None	Deliberately zero decorative imagery — clean title over whitespace
About photo	Not yet supplied	Left text-only rather than substituting a generated headshot

Keepers — real captures (own work)

Login — scoped session start Chat — session-scoped view Security Test — 6/6, real output

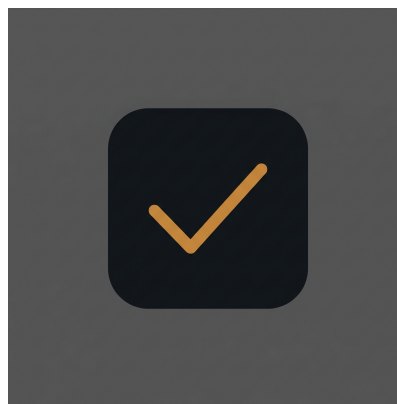

All three are unedited captures of the working prototype, not generated stand-ins — this is the proof itself, so it has to be real.

Generated connective tissue — icon iteration

Two passes, same prompt intent (flat checkmark mark, near-black + single amber, no gradients), iterated to hold the kit's style steady.

v1 — REJECTED

v2 — kept (secondary use only)

Rejection note (v1)

Rejected for three specific, checkable reasons, not preference: (1) a visible bevel/highlight along the checkmark and border — the prompt explicitly asked for no gradients or lighting effects, and the model added one anyway; (2) the amber rendered noticeably more saturated/orange than the kit's exact #C98A3E, breaking hex consistency; (3) it's an outlined-stroke mark, while the site's existing hand-coded favicon is a solid-fill mark — side by side they'd read as two different people's work, not one identity.

v2 — accepted, with a caveat

The re-prompt (explicit 'solid fill, no outline, no highlight') fixed the two biggest problems: the fill is now solid and the stroke is thin rather than chunky. Two smaller issues remain — a faint vignette on the black fill, and a softer, more 'app-icon squircle' corner radius than the kit's sharper original mark. Given that, this version is kept as a secondary asset only (e.g. a larger-format app-tile or social preview graphic), not as a replacement for the site's actual favicon: a favicon is shown too small for these two flaws to matter, but it's also small enough that hand-coded SVG gives exact, artifact-free control a generated raster can't guarantee. That's the judgment call — not 'generated vs. real,' but knowing which job each one is actually good for.

Where a real photo would be used

The About section is the one place on the page where the subject would be a real person (me). No photo has been supplied yet, so that slot is left text-only rather than filled with a generated headshot-style image — a generated 'person' standing in for an About photo would be actively misleading, not just a style choice.
