

Break Your Own Site

Where it breaks, SEO/speed evidence, fix-now vs. known-limitation

Where it breaks — full findings list

Finding	Sort	Status
Empty form submission	Expected behavior	Blocked natively by HTML5 required attributes — browser shows its own validation message.
Garbage/malformed email	Expected behavior	Blocked natively — type="email" enforces a valid email pattern before submit.
Submit twice fast (double-submit)	FIX-NOW	Was unguarded. Fixed: submit button now disables and shows "Sending..." on first click, blocking a second submission.
Unbounded input length (garbage/huge paste)	FIX-NOW	No limits existed. Fixed: added maxlength (120/180/2000) to name, email, and message fields.
Missing SEO/social meta	FIX-NOW	No meta description, Open Graph, or Twitter Card tags existed. Fixed: added all three, plus a canonical link.
Images oversized for their display size	FIX-NOW	Screenshots were ~3x their displayed width. Fixed: resized to real display resolution and converted to WebP — 267KB → 60KB combined.
Render-blocking font stylesheet	FIX-NOW	Google Fonts CSS was loaded synchronously (~1,720ms blocking, per PageSpeed). Fixed: switched to the async preload + media="print" swap pattern.
Site not yet indexed by Google	Known limitation (attempted)	Verified ownership in Google Search Console and submitted a Request Indexing — blocked once by Google's own daily quota on first attempt, not something under my control; expected to resolve within days regardless.
All outbound links (LinkedIn, GitHub, CV, eval scripts/CSVs, mailto)	Checked, no break found	Clicked every link including demo/repo artifacts — all resolve correctly.
Different/untested browser	Checked, no break found	Opened in a browser not used during development — layout and functionality held.

SEO / meta added

Added: meta description, canonical URL, Open Graph tags (title/description/url/image), Twitter Card tags (summary_large_image). Page title updated to include name for findability. Result: PageSpeed Insights SEO score 100/100 (both mobile and desktop).

Speed check (PageSpeed Insights, real runs — before and after the fixes)

	Performance	Accessibility	Best Practices	SEO
Mobile — before	88	98	100	100
Mobile — after	100	98	100	100
Desktop — before	99	98	100	100
Desktop — after	99	98	100	100

Mobile Performance moved from 88 to a perfect 100 after fixing the render-blocking font request and resizing/converting the screenshots to WebP — confirming both fixes were real, not cosmetic. Desktop was already near-perfect and held steady.

Known limitations (named, not hidden)

- Google indexing is not yet complete — the site is brand new with no backlinks; normal for a fresh domain and expected to resolve within days to weeks even without further action.
- Google Search Console's Request Indexing hit a daily quota on first attempt — outside my control, will retry.
