

Mobile & Accessibility Fix Log

Real issues found and fixed on the live portfolio

Audited the deployed site's CSS and markup directly (colors measured against WCAG contrast math, not eyeballed) rather than only resizing a desktop browser window.

Problem found	Where	Fix
Muted text color (#6B7078) measured 3.6:1 contrast against the dark background — below the WCAG AA minimum (4.5:1) for normal-size text. Affects labels, captions, and secondary contact text sitewide.	--text-muted CSS variable, used across eyebrows, captions, contact links	Replaced with #929AA6, measured at 5.8–6.3:1 against both background shades — passes AA with margin, same neutral tone.
Contact form inputs used 14px font-size. iOS Safari auto-zooms the page when a user taps any input under 16px, a known and jarring mobile bug.	.form-row input, .form-row textarea	Raised to 16px — stops the involuntary zoom on iPhone when the form is tapped.
The architecture diagram (SVG) scales to 100% of container width. On a ~375px phone screen, its internal text (12–14px at native size) shrinks below legible size.	.diagram-wrap svg	On narrow screens, the diagram now holds its native readable width (560px) inside a horizontally scrollable container instead of shrinking — text stays legible, user scrolls sideways to see the full diagram.
Checked: all outbound links (LinkedIn, GitHub, CV, mailto), image file sizes, viewport meta tag.	Sitewide	No breaks found. GitHub link verified live and resolving to the real profile. Screenshot images are 63–128 KB each — not oversized. Viewport meta tag was already correctly set.

Still to verify on a real phone

- Open the live URL on an actual phone (not just a resized desktop browser) and confirm the contact form no longer zooms in when tapped.
- Scroll through the architecture diagram sideways on a real phone to confirm it's readable at native size.
- Take a before/after screenshot on the phone for the submission — the 'before' state can be reconstructed by temporarily reverting the font-size to 14px locally if a true before-shot wasn't captured live.

Note: the two visual fixes (contrast color, diagram scroll behavior) are code-level changes verified by direct CSS/contrast-math inspection, not by eye — confirming them on a real device is the remaining step before calling this fully checked.
