

Send the Link: Keep It Alive

How the next case study gets added, what it is, and the reminder that's set

1. How the next case study gets added

Where it goes: as a second case study block on the same single-page portfolio, placed directly after the existing security case study (before About) — the content map already treats “lead with the strongest work” as the rule, so the newer or stronger case leads, and the two stay next to each other rather than needing a new page.

Steps to add one:

1. Gather real evidence first — screenshots, notebook outputs, real numbers. No case study gets written before the evidence exists.
2. Open the Claude Project and describe the work in messy, honest fragments (the same interview approach from Week 2) until the problem, the decision, and the result are clear.
3. Draft it in the same three-beat shape: problem → what I did (and decided) → what came of it. Use the voice card already saved in the Project — don't re-decide tone from scratch.
4. Reuse the identity kit exactly as-is (Inter, the three-color palette, the same layout patterns) — no new design decisions, just new content in the existing shell.
5. Get one real round of outside feedback (the same crit process from Week 7) before calling it done.
6. Publish, then re-check the one thing every case study needs: does it still ladder up to the single CTA (“Send message”), not a competing action.

2. The next real piece of work, named

FlyRank ML capstone — Lane 2 (content refresh / opportunity scoring). Not hypothetical: the notebooks (w01–w07), the validated Random Forest model, the signal audit, and the action playbook already exist in the FlyRank-intern repo. Once the capstone itself is graded and approved, it becomes Case Study 2 — a second, different proof point (ML/data science rigor, not security) sitting next to the first.

3. The reminder — evidence it's set

Rather than a date-based calendar nudge (no fixed date exists yet — the capstone finishes on its own timeline), the reminder is placed exactly where it will actually be seen: inside

work/capstone_report_template.md in the FlyRank-intern repo, the file that gets filled in at the moment the capstone is finished. This is an event-triggered reminder, not a date-triggered one — it fires naturally at the exact moment the next real piece of work is done, which is more reliable than guessing a date now.

■■■ Portfolio reminder (set FL Week 10): once this capstone is graded and approved, add it to the portfolio as Case Study 2, right after the security case study. Reuse the Week 2 three-beat shape... and use the Claude

Project — it already knows the voice, stack, and identity kit, so this should be a short conversation, not a rebuild.”

Committed directly to the repo file that will be open at exactly the right moment — see the attached capstone_report_template.md, or the repo's own commit history.

Build context preserved

The Claude Project used throughout this build already holds the voice card, the identity kit (fonts, palette, style note), and the full history of every decision made on Case Study 1 — nothing further needs to be reconstructed for Case Study 2 to start.
